

Atrium Royal College of General Practitioners London full of daylight and fresh air

Due to glass ventilation windows in near-flat structural glass roof

A pleasant day-to-day ventilation, sufficient daylight and an adequate smoke and heat extraction system (SHEV) was essential for the headquarters of The Royal College of General Practitioners in London. Certified Brakel Partner Delta Ventilation provided a solution using the Brakel® Lumera ventilator meeting all of the design and aesthetical requirements.

Ventilation window for structural skylights

For smoke and natural ventilation purposes, the building required glass ventilation windows which had to be installed in a near flat structural glass roof. Delta Ventilation's team designed the resulting scheme using Brakel® Lumera ventilators linked to the building BMS.

Satisfied client

The result: an open, pleasant building with a nice inner climate. The client is "delighted with the final solution".
